

Chicago Food Inspections

Caden Ebert & Elias Kinder

Overview

Risk Level (1: High - 2: Medium - 3: Low)

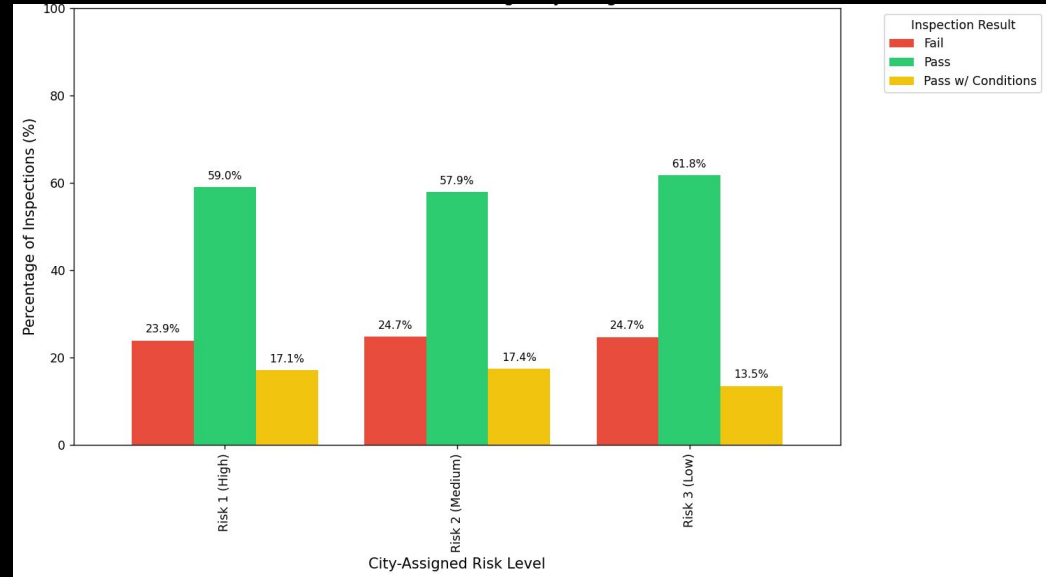

Risk is categorized by likelihood of causing adverse health effects on the public

- **Assigned by how often they are inspected**

Is Risk Level effective at telling how “risky” it is to go to a certain establishment?

Pass Rates by Risk Type

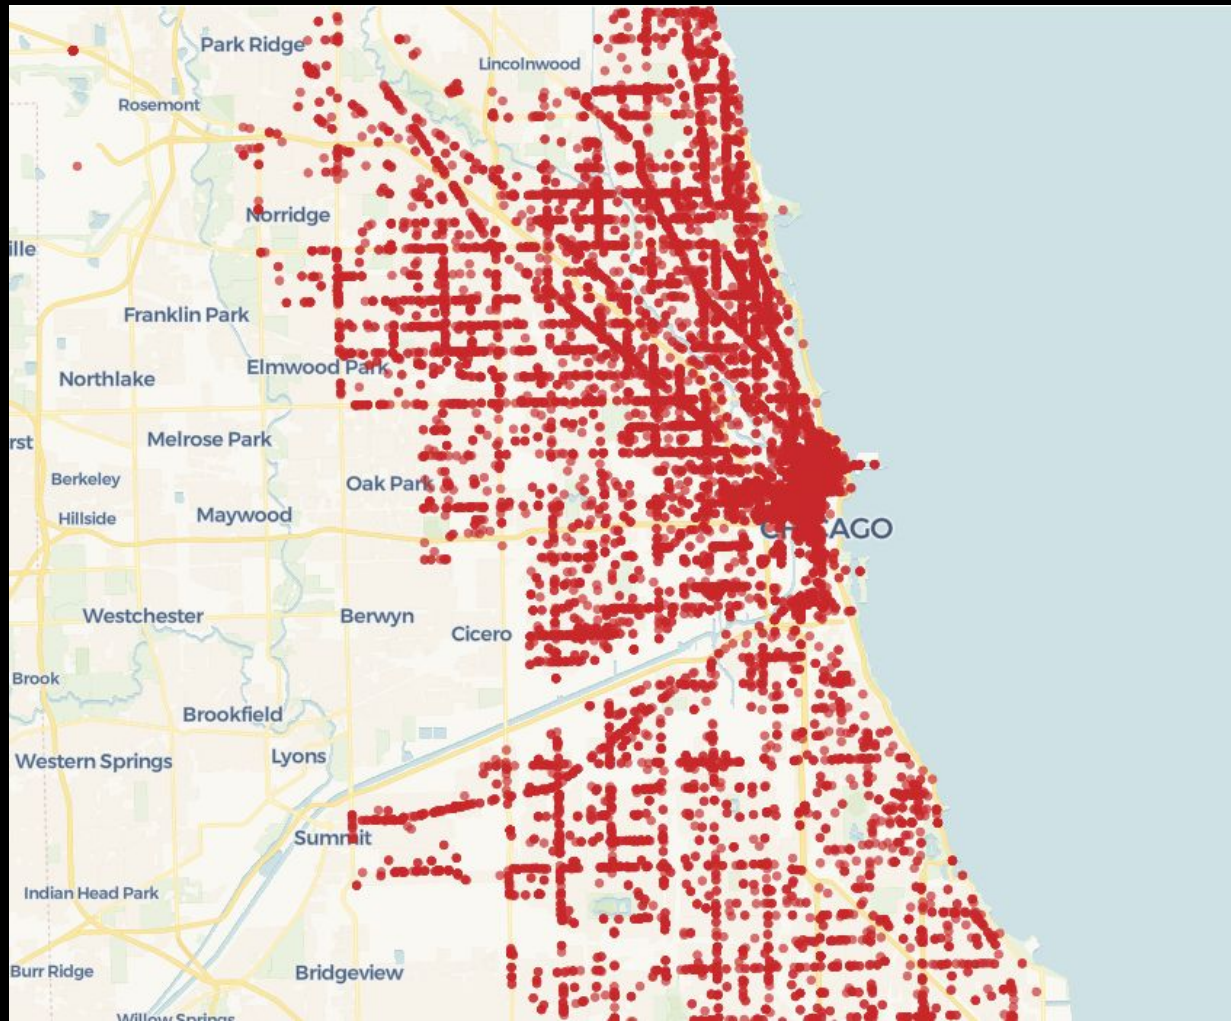

Does risk classification actually predict inspection outcomes?

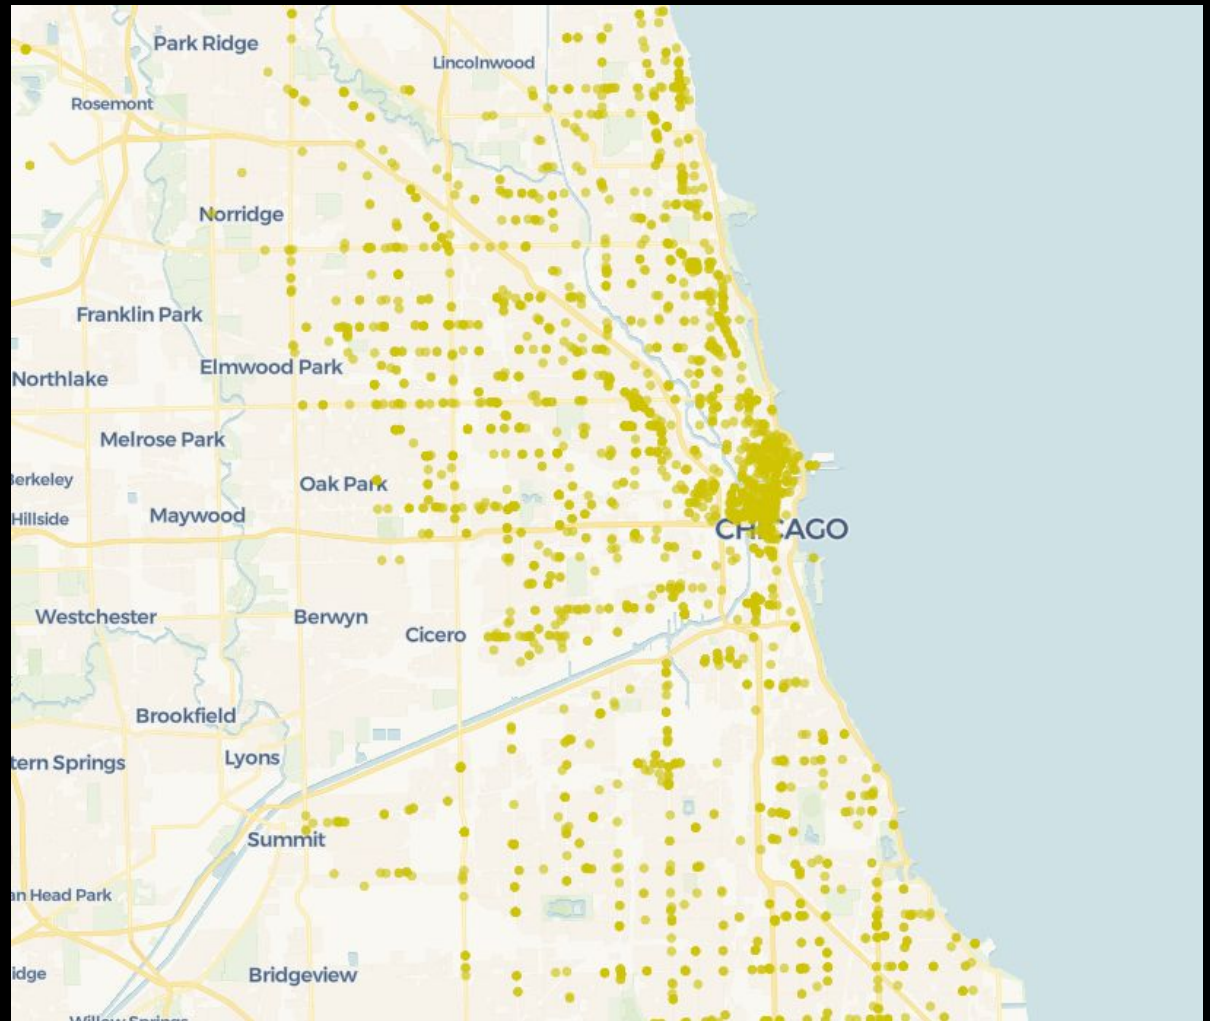

Chicago Health Violation Map

Is there a correlation between area and assigned risk ?

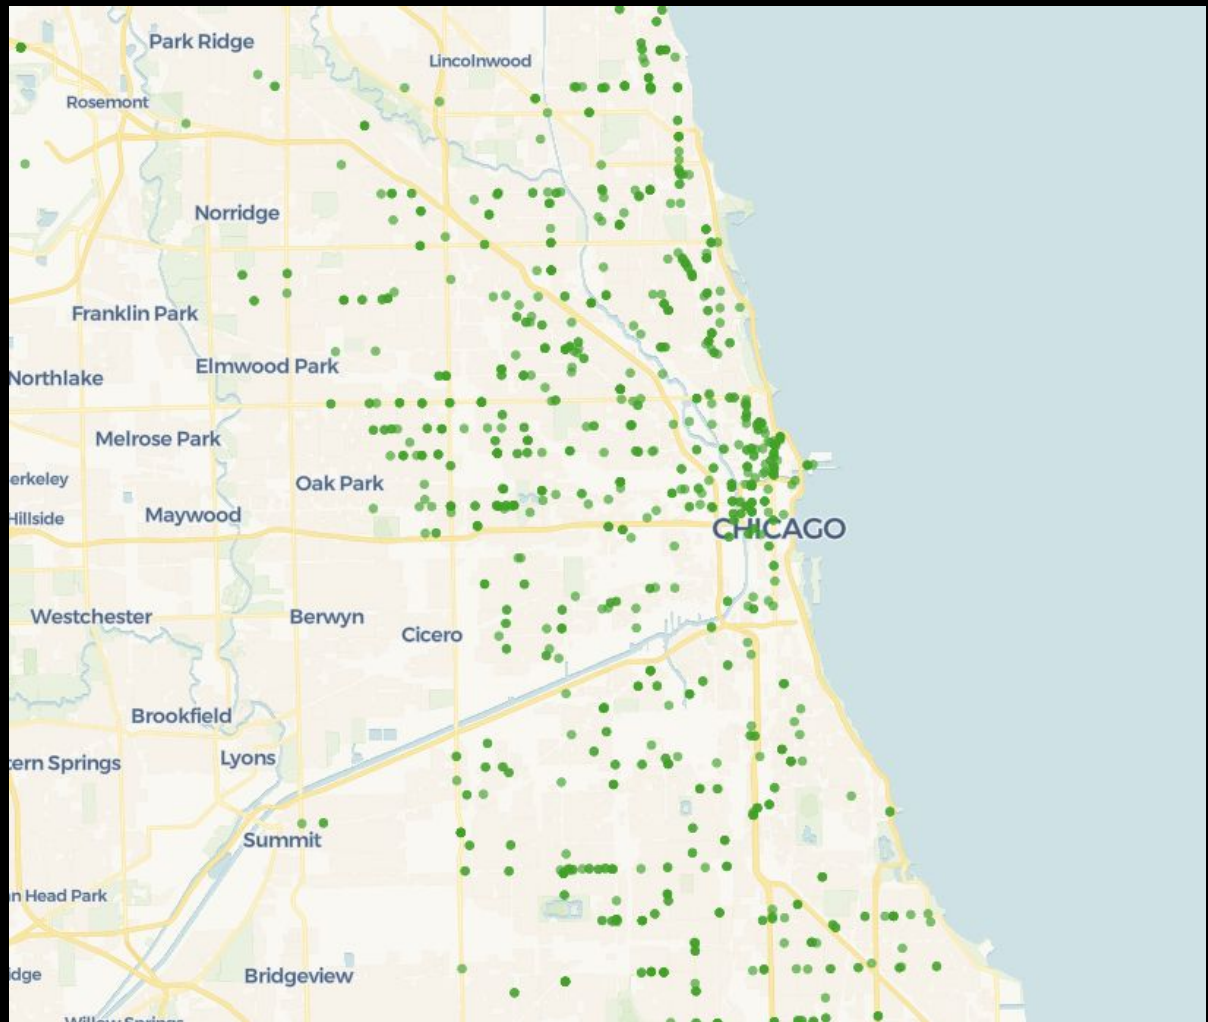

Risk 1 - High

Risk 2 - Medium

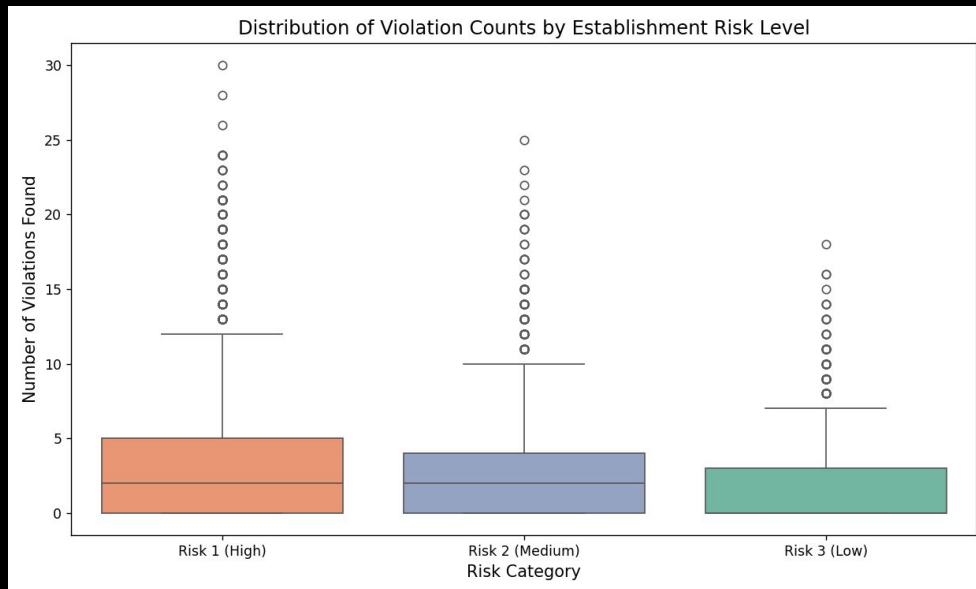

Risk 3 - Low

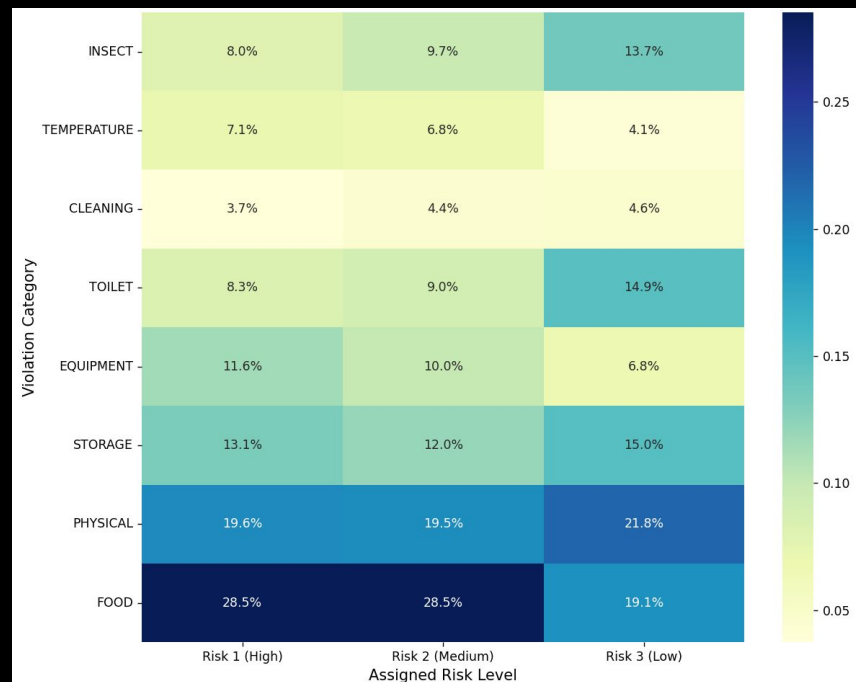

Amount of Violations by Risk Type

Is there a relationship between establishment risk level and violation counts?

How Risk Level Shapes Violation Patterns

Is the type of violation correlated with the level of risk assigned to it?

Conclusions

Medium and High level risk indicate commonly found food related “risks”

- **Little to no correlation between area and risk density**
- **Risk has little to no effect on passing rates of inspections**
- **Risk level is correlated with number of violations per establishment**
- **Type of failure is correlated with the level of risk**

THANK YOU
